

# Can photovoltaic panels be bolted directly

## Overview

---

It's never a good idea to bolt (or fastener) directly through a horizontal surface of a low slope roof and in most cases it's actually against the building code (if not properly covered or overlaid by an approved method). For PV modules, the racking and mounting system typically consists of the following: a two-railed track that is bolted into the rafters and onto which the panels are clamped, a flashing component for weatherproofing the penetrations, and all required hardware such as bolts and clamps. Technically, for a method of installation of building materials to be. Honestly, you can't just buy a stack of solar panels, toss them on a roof, and expect a smooth ride. That whole system—the panels, the racks, the wiring—has to be engineered to survive. These components are made from stainless steel, ensuring long-lasting durability and high corrosion resistance. Mountkit by Enerack solutions allow minimal roof.
