This chapter introduces various solar thermoelectric technologies including micro-channel heat pipe evacuated tube solar collector incorporated thermoelectric power generation system, solar concentrating thermoelectric generator using the micro-channel heat pipe. Solar thermal power generation, with its regulation characteristics comparable to conventional thermal power units, can quickly and deeply participate in power grid peak shaving and frequency modulation, thereby enhancing the flexibility of the power system. It is a promising renewable energy. Solar thermal collectors and thermoelectric generators (TEGs) work in tandem to harness the ample solar energy available and convert it into electrical power. CSP systems have the ability to provide electricity, refrigeration and water purification in one unit. This technology will be extremely helpful in improving the quality of life for many people around the world who lack the.
