Overview

Molybdenum disulfide (MoS_2) emerges as a promising material for advanced energy storage devices, particularly batteries and supercapacitors. As the demand for efficient and sustainable energy storage solutions grows, MoS_2 attracts considerable attention due to its unique properties such as high. The top energy storage technologies include pumped storage hydroelectricity, lithium-ion batteries, lead-acid batteries and thermal energy storage. Electrification, integrating renewables and making grids more reliable are all things the world needs. However, these can't happen without an increase. Hydrogen production via water electrocatalysis is considered a promising green fuel technology for addressing global energy and environmental challenges while supporting sustainable development. Many atomically thin materials have provided a unique opportunity to develop highly efficient small-scale devices. We report an ultramicro-electrochemical capacitor with two-dimensional (2D) molybdenic hydrothermal process. The addition of the 1D MnO_2 nanorod offers.
