Overview

Building photovoltaic solar energy systems on hillside properties requires careful consideration and planning, focusing on 1. Environmental impact assessment. Each photovoltaic ground installation project faces many challenges, but one of the pressing obstacles to overcome is how to design the most effective system when faced with significant terrain changes. Ground-mounted solar panels are mostly installed in flat open area, but flat topography is not. Actually a ground mount is the way to go over a roof mount if you have the land especially if you get snow. Roof mounts also introduce areas for problems with leaks and if you ever have to change your roof you gotta remove all the panels. That area looks perfect for a few killwatts. Due to wind in this location (120mph) and a one week old new roof, it has been recommended to not go roof mount.
