

Household products considered as organic compounds and essential substances

Overview

Fuels like gasoline and natural gas are organic compounds derived from fossilized matter, powering vehicles and homes. Many common household items, including detergents, dyes, and textiles, are also organic. Many VOCs are human-made chemicals that are used and produced in the manufacture of paints, pharmaceuticals, and refrigerants. VOCs typically are industrial solvents, such as trichloroethylene; fuel. From the moment we wake up to the minute we fall asleep, organic compounds play a quiet yet vital role in how we live, breathe, clean, cook, communicate, and thrive. They are in our food, our bodies, our clothes, our medicine cabinets—even in the air freshener we spray in the bathroom. Even products advertised as "green" or "natural" may contain ingredients that can cause health problems. Not all organic molecules need to have all six of these elements, but they have to have at least carbon and hydrogen.

Household products considered as organic compounds and essential

What are volatile organic compounds (VOCs)? , US EPA
