

# Isolation method of solar inverter

## Overview

---

Turn off the system by turning off the solar inverter and the main AC disconnect to stop the flow of electricity. A solar photovoltaic (PV) inverter converts electrical power from a solar panel and deploys it to the utility grid efficiently. DC power from the solar panels, which act like a dc current source, is converted to ac and fed onto the utility's grid in the correct phase relationship—with up to 98%. Fossil-fueled electric power facilities have proven to be robust and reliable sources of energy for more than a century, but these tried-and-true facilities are large, complex and increasingly expensive to build. STEP 2: Go to the AC Isolator nearest the Consumer Board and switch to the 'OFF' position STEP 3: To re-energise your system, follow the above steps in reverse. Isolating your Inverter from Solar PV and Grid. Besides solar panels, the electronic components, such as PV inverters, are the major cost components. Bonding ties all metallic components together so no dangerous voltage difference exists between racks, frames, or chassis. Isolation keeps certain conductors intentionally floating, often in transformerless inverter.
