## Overview

---

Microgrid design involves critical decisions across multiple dimensions, including load coverage (from critical-only to full load), operational duration (2 hours to indefinite), Distributed Energy Resources (DER) (various combinations of photovoltaic (PV), Battery Energy Storage). Microgrid design involves critical decisions across multiple dimensions, including load coverage (from critical-only to full load), operational duration (2 hours to indefinite), Distributed Energy Resources (DER) (various combinations of photovoltaic (PV), Battery Energy Storage). Resilience, efficiency, sustainability, flexibility, security, and reliability are key drivers for microgrid developments. These factors motivate the need for integrated models and tools for microgrid planning, design, and operations at higher and higher levels of complexity. This complexity ranges from simple to complex for each microgrid. An initial feasibility assessment by a qualified team will uncover the benefits and challenges you can expect for system operation. Internal financing allows you to take full advantage of the economic benefits. Historical data is crucial to ensure that proposed microgrid solutions enhance system reliability and resilience, with site-specific reviews of current systems and maintenance practices providing insights for effective microgrid integration and outage mitigation. Coalition stakeholders include the City of Oakridge, South Willamette Solutions, Lane County, Oakridge Westfir Area Chamber of Commerce, Good Company/Parametrix, Oakridge Trails. A microgrid is a grouping of local, distributed energy resources that can be operated either connected to the utility in parallel or disconnected from the utility in island mode. Microgrids provide more than power.
