

Solar power generation can drive air conditioning

Overview

How it Works: During the day, your solar panels generate power. This power is immediately converted to AC by a string inverter and sent to your home's electrical panel. Your air conditioner draws from this solar power first, only pulling from the grid if it needs more. This DC electricity is then typically inverted into alternating current (AC) electricity, which is the type of electricity used in most homes and businesses to power appliances like air. Air conditioning is basically the single biggest energy expense for most homeowners during summer—often \$200+ monthly just to stay cool. The challenge here is that Air conditioners are notorious energy. Not only can solar-powered air conditioners reduce greenhouse gas emissions, but they can also help slash utility bills.
