

Solar turbines generate electricity

Overview

Solar power generates electricity by using either solar thermal systems that convert sunlight into heat to produce steam that drives a generator, or photovoltaic systems, which transform sunlight into electricity through the photovoltaic effect. This energy can be used to generate electricity or be stored in batteries or thermal storage. These two methods are revolutionizing how we harness. A solar turbine system harnesses the sun's energy by concentrating it to generate intense heat, a process known as Concentrated Solar Power (CSP). Unlike photovoltaic (PV) panels, which convert light directly into electricity, CSP uses solar radiation as a high-temperature fuel source to drive. Solar cell When sunlight strikes a solar cell, an electron is freed by the photoelectric effect. Both are generated through the use of solar panels, which range in size from residential rooftops to 'solar farms' stretching over acres of rural.
