

Supporting photovoltaic energy storage

Overview

Energy storage can provide multiple grid services. It can support grid stability, shift energy from times of peak production to peak consumption, and reduce peak demand. Solar-plus-storage shifts some of the solar system's output to evening and night hours and provides other grid. For solar-plus-storage—the pairing of solar photovoltaic (PV) and energy storage technologies—NLR researchers study and quantify the economic and grid impacts of distributed and utility-scale systems. Much of NLR's current energy storage research is informing solar-plus-storage analysis. Energy. The Building Energy Efficiency Standards (Energy Code) include requirements for solar photovoltaic (PV) systems, solar-ready design, battery energy storage systems (BESS), and BESS-ready infrastructure. Photovoltaic (PV) materials and devices convert sunlight into electrical energy. A single PV device is known as a cell, which typically produces about 1-2 watts of power.
