

# The correct posture for carrying photovoltaic panels

## Overview

---

The optimal method for securing panels is to transport them vertically, resting on their longest edge, similar to how large sheets of glass are moved. Due to the large, awkward dimensions, panels should always be carried by two individuals, ensuring a stable and balanced weight. The need for transporting solar panels in an undamaged condition remains one potent factor left undiscussed. These solar modules contain tempered glass and delicate cells that are prone to damage. Use the right-size forklift forks based on the pallet size. Protective Cardboard Corners: To do this we had to analyze the way panels are carried to the roof and develop a method to complete the same process using less energy in a way that is versatile and economical for any installer. How does it work?

Here's the basics.
