

# The system has no energy storage initially

## Overview

---

In systems involving energy management, the phrase “the system does not store energy initially” signifies several implications, including 1. immediate energy availability, 2. system functionality and efficiency considerations, and 3. Ac coupled systems have a battery inverter, which makes a "micro-grid" that is connected to an interactive (grid-tie) inverter. In ac coupled systems, the interactive inverter can charge the batteries through the battery inverter (inverter/charger) when there is more power produced than used by. Battery storage is a technology that enables power system operators and utilities to store energy for later use. A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to. The goal of the DOE Energy Storage Program is to develop advanced energy storage technologies, systems and power conversion systems in collaboration with industry, academia, and government institutions that will increase the reliability, performance, and sustainability of electricity generation and distribution. Let's face it - our power grids are acting like that friend who never saves money. They produce, they distribute, but they don't store. The concept of no energy storage after normal power supply is like running a bakery that tosses unsold croissants every evening. While BESS technology is designed to bolster grid reliability, lithium battery fires at some.
