

# Wind power speed increaser generator assembly

## Overview

---

The paper presents the kinematic and static modelling of a planetary speed increaser with one input and two outputs and a closed power loop, which is required in establishing the power flow transmitted by the increaser from a wind rotor to a counter-rotating electric. The paper presents the kinematic and static modelling of a planetary speed increaser with one input and two outputs and a closed power loop, which is required in establishing the power flow transmitted by the increaser from a wind rotor to a counter-rotating electric. The present invention relates to an accelerator for a wind turbine, and more particularly, to an accelerator installed in a wind turbine, comprising: a stationary plate; A first gear shaft mounted on an upper portion of the fixing plate to receive and transmit a rotational force transmitted from a durable, but unlikely to convert more than 40% of the available wind energy. Different solutions are proposed to minimize WT energy loss and improve performance, such as the use of speed increasers, counter-rotating wind rotors or counter-rotating electric generators. Downsizing the design, saving.
